

# Food GETTING STARTED

## Why This is Important

### 1. Food may not be available as the pandemic progresses.

- Grocery stores typically stock three days' worth of food at most. It is on the shelves, not in a warehouse. This just-in-time delivery system works for normal times. When disaster strikes or is imminent (such as a hurricane), the shelves are quickly emptied.
- Re-stocking grocery stores is uncertain during a pandemic or other disruptive emergency. Getting food from the farm to the table is a very complex system. In a flu pandemic, farmers, food processors and truck drivers will get sick too, which means that grocery stores may run out of food.
- Government assistance is unlikely.

### 2. You reduce your exposure to the flu virus by minimizing your trips away from home.

## Getting started

**What kind of food?** Store what you already eat. By doing this, you avoid adding dietary stress to an already stressful situation.

**How can I ever do this?** Start now, but don't defeat yourself.

Break the task of stockpiling down into stages. Getting your pantry stocked for two weeks is a good initial goal. Simply write down what you eat over a two-week period. Then add a few extra items on each shopping trip. Look for specials and bulk purchases. Remember to add lunches for children who are normally at school, as well as infants and toddlers.

Once you've reached this goal, go for four weeks of food, then eight, and then twelve. In a few months, you will have a full pantry of your kind of food!

Emergency Pantry

- Do not mix old and new lots of foodstuffs. If the old material is infested, the pest will quickly invade the new.
- Clean old containers before filling them with fresh food. They may be contaminated and cause a new infestation.
- Do not purchase broken or damaged packages of food materials. They are more likely to become infested.
- Construct storage units so that they are tight and can be cleaned easily.
- Store bulk materials, such as pet foods, in containers with tight-fitting lids.
- Keep storage units dry. This is important because moisture favors the development of pantry pests; dryness discourages them.
- Some pantry insects breed in the nests of rodents and insects and may migrate from these into homes. Eliminate any nests found in or near the home.
- Pantry pests can also breed in rodent baits. Be sure to frequently check and discard infested baits.

## **Small Spaces, Small Budgets**

Storing a lot of food in limited space is challenging, but it is being done. An outstanding how-to, "*Stockpiling Food for Small Spaces and Small Budgets*," is available at the downloads section on the homepage of this site.
